Re: Rail Crossing Air Monitoring
BNSF Personnel
Jay Effar Road and Cedar Creek Crossings
Libby, Montana
EMR Project No. 5539.100

Dear Mr. McCaskill:

EMR, Inc. (EMR) was contacted by the BNSF Railway Company (BNSF) to conduct personal air monitoring on the local BNSF Maintenance-of-Way crew during track crossing replacement at Jay Effar Road and Cedar Creek in Libby, Montana. EMR commenced with air monitoring during replacement of the Jay Effar Road crossing on July 22, 2008, finishing on July 23, 2008. EMR returned to conduct air monitoring on the Cedar Creek Crossing on July 29, 2008. Air monitoring was conducted to evaluate for the potential presence of airborne contaminant asbestos fibers associated with rail transport of W.R. Grace vermiculite ore or processed Zonolite shipped on this line through approximately 1990, the date of the mine closure.

Dan McCaskill, Manager Industrial Hygiene for BNSF, was on-site to communicate personal protective equipment (PPE) requirements of the work activity to the BNSF crew and to observe air monitoring activities by EMR. Nicole Bein, CDM representative, was on-site to observe work activities on behalf of EPA. David Welch, Project Site Manager for EMR, was on site to conduct personal air monitoring and PCM analysis of air samples collected from the BNSF track replacement crew and deliver air cassettes to EMSL ‘s Libby laboratory for AHERA TEM analysis.

Attached are a site location map, photolog of work activities, air monitoring data sheets with PCM air monitoring results, TEM results from EMSL laboratory and signed chain-of-custodies for samples submitted to EMSL lab.

Site Activities-Jay Effar Road
Crossing replacement activities commenced on July 21, 2008. However, there was no soil/ballast disturbance during initial activity of pulling rubber crossing panels and no air monitoring was conducted until the following day. On July 22, 2008, BNSF conducted track replacement of the siding track adjacent to the mainline. The work consisted of cutting the rail section spanning across the crossing, pulling the rail and ties out of the crossing, excavation of a limited quantity of track bed, removal and replacement of deteriorated ties and re-connecting the rail section with bolt plates. Following replacement, fresh ballast was placed over the track bed, tamped, regulated and raised to the proper

elevation. A water truck was utilized throughout the work activity for dust control. During this activity, EMR placed Gillian BDX II personal air pumps equipped with Zefon (Lot #15466) 25mm PCM cassettes with 0.8 um MCE filters on five BNSF employees:

Stu Hart, Tamper, BNSF Employee #5506852;
Kerry Tunison, Crew Foreman, BNSF Employee #2650224;
Tim Swilley, Ballast Regulator, BNSF Employee #7451719;
Roger Stanley, Ground Crew, BNSF Employee #7456288; and
Doug Atkins, Ground Crew, BNSF Employee #1689297

These samples were labeled samples #1 through #5 with two blanks labeled #6 and #7. Based on BNSF Maintenance-of-Way Track Time allowance to conduct the work, the BNSF crews worked continuously during track replacement activities. 3M half face respirators and tyvek suits were worn by BNSF personnel during the work activity. Work activities were temporarily suspended during eastbound and westbound train movement throughout the replacement.

Following phase contrast microscopy (PCM) analysis and at the request of BNSF, EMR delivered select air samples (#2 through #5) to the EMSL Libby laboratory for transmission electron microscopy (TEM) by the AHERA method.

Work resumed on July 23, 2008. Two additional BNSF employees were monitored:

Tom Long, Loader Operator, BNSF Employee #4876306; and
Tom Dinning, Ground Crew, BNSF Employee #1689413

Employees from the previous day were monitored again with the exception of Roger Stanley, Ground Crew. The front-end loader equipment was primarily used to scrape ballast and soil from the track section removal area to allow placement of the replacement track section. In addition, the loader was used to maintain a right-of-way fire line to help protect the mainline and sidings from potential forest fires during fire season. Following phase contrast microscopy (PCM) analysis of the July 23, 2008 samples, EMR delivered select air samples (#9, #11, #12 and #13) to the EMSL Libby laboratory for transmission electron microscopy (TEM) by the AHERA method. Sample #12 was too overloaded for PCM analysis but was acceptable for TEM analysis.

Analytical Results-Jay Effar Road
Based on PCM results, four of five samples were submitted for TEM analysis for July 22, 2008 and four of six samples submitted on July 23, 2008. No detectable asbestos structures were identified by TEM on any of the samples.

Site Activities-Cedar Creek Road Crossing
The Cedar Creek Road crossing replacement was conducted on July 29, 2008. The crossing replaced was mainline track. No siding track was present on this crossing. Dan McCaskill, BNSF Manager of Industrial Hygiene, was not available to observe operations. However, EMR was in communication with Mr. McCaskill during all site activities. Ms. Nicole Bein of CDM Federal Programs was on-site during the replacement of the Cedar Creek Crossing to observe operations on behalf of EPA. Track time to conduct the work was limited with westbound and eastbound freight trains held up until track could be re-connected. Though a water truck was requested by BNSF industrial hygiene to be on-site for dust control at the time of track replacement, no water truck was available during site activities. Any visible dust created during the crossing work was primarily related to replacement ballast regulating activities following track section connection; dust related to soil and ballast under the track bed was limited. This

work consisted of cutting the mainline rail section spanning across the crossing, pulling the rail and ties out of the crossing, excavation of a limited quantity of track bed, removal and replacement of deteriorated ties and re-connecting the rail section with bolt plates. Following replacement, fresh ballast was placed over the track bed, tamped, regulated and raised to the proper elevation. During this activity, EMR placed Gillian BDX II personal air pumps equipped with Zefon (Lot #15466) 25mm PCM cassettes with 0.8 um MCE filters on six BNSF employees:

Doug Atkins, Ground Crew, BNSF Employee #1689297
Tom Long, Front end Loader Operator, BNSF Employee #4876306
Roger Stanley, Ground Crew, BNSF Employee #7456288
Kerry Tunison, Crew Foreman, BNSF Employee #2650224
Tim Swilley, Ballast Regulator, BNSF Employee #7451719; and
Greg Carter, Ground Crew, BNSF Employee #5508833

Because no water truck was available for dust control, all of the six personal samples were submitted to EMSL Labs for analysis by AHERA TEM. These samples were labeled #16 through 21 as well as two blanks labeled #22 and 23.

Analytical Results-Cedar Creek Road Crossing
Sample #16 worn by Doug Atkins, BNSF Ground Crew was considered dust overloaded by the EMSL Libby lab. EMR requested that this overloaded sample be tested for AHERA TEM by the indirect preparation method to allow TEM analysis. No detectable asbestos structures were identified by TEM on any of the samples.

EMR appreciates this opportunity to be of service. If you have any questions, please call at your earliest convenience.

Best Regards,

David L. Welch

Disclaimers: The laboratory is not responsible for data reported in structures/cc, which is dependent on volume collected by non-laboratory personnel. This lab is only responsible for data reported in structures/mm^2. This report may not be reproduced, except in full, without written approval by EMSL. This report must not be used to claim product endorsement by NVLAP or any agency of the U.S. Government. This report relates only to the samples reported above. Quality control data (including 95% confidence limits and laboratory and analysts' accuracy and precision) is available upon request. As per 40 CFR 763, the initial screening test may not be applied to samples with collected volumes of <1200 liters. The test results contained within this report meet the requirements of NELAC unless otherwise noted. Samples received in good condition unless otherwise noted.

Accredited for NVLAP PLM/TEM. NVLAP Libby code: 200745-0
